

Prediction of CO2 Emissions

Poojaa Ravindra Guptha - U1083384

INTRODUCTION

Since it is a vital metric for understanding how well we are doing in slowing down global climate change, the CO2 Prediction is performed out in this project. There are various attributes that increase the accuracy of the model. The prediction is done using Multiple linear regression.

DATA COLLECTION

The dataset that I have used in this project is Carbon dioxide emission based on various attributes. Totally there are 500 rows with 11 input columns and 1 output column. The input columns of the model are

1. Make
2. Model
3. Vehicle Class
4. Engine Size(L)
5. Cylinders
6. Transmission
7. Fuel Type
8. Fuel Consumption City (L/100 km)
9. Fuel Consumption Hwy (L/100 km)
10. Fuel Consumption Comb (L/100 km)
11. Fuel Consumption Comb (mpg)

DATA PREPROCESSING

Removing Null values:

The datasets are cleaned by removing null, nan values.

Readable format:

The column names of the datasets are changed into an understandable format.

Label Encoding:

Finding the numeric and non-numerical values from the datasets. The non-numerical values are changed to numerical values by performing Label encoding.

Outlier Detection:

The outliers are detected for all the attributes in the datasets.

DATA VISUALIZATION

Box Plot:

The box plot is constructed to visually represent the attributes of the data.

Bar Plot:

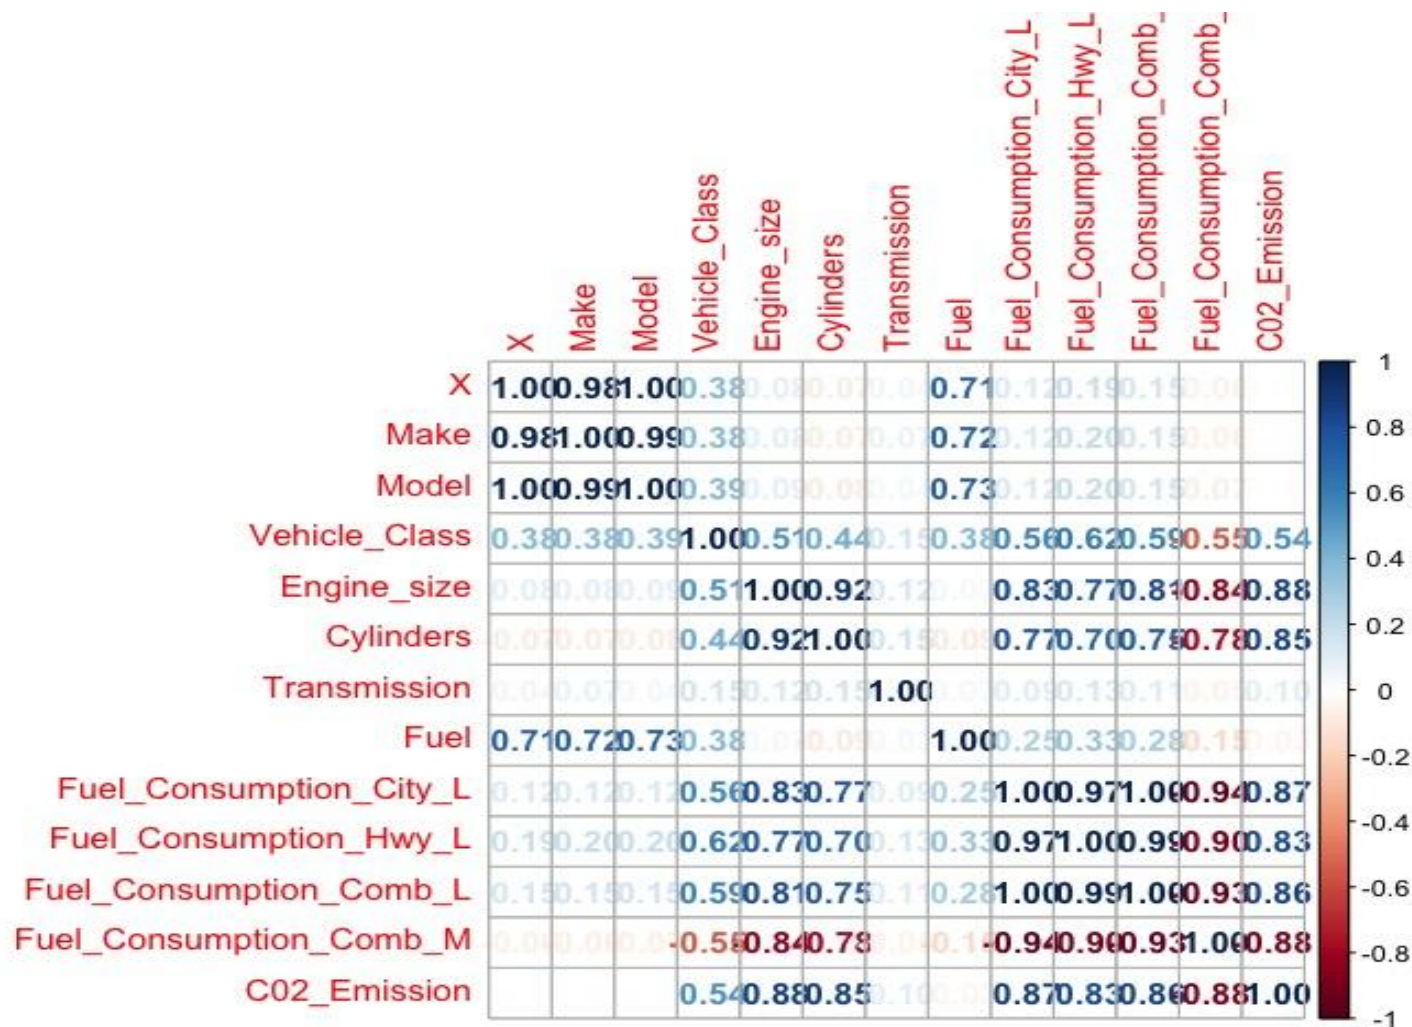

The bar plot is created to find the frequency of the attributes in the dataset.

Correlation matrix:

The correlation matrix graphically represents the features that are important for the prediction.

Pair-wise plot:

The pair-wise plot represents the relationship between each and every attributes in the dataset.

Boxplot

Boxplot

CONCLUSION

Thus the prediction of CO2 Emissions is performed using Multiple linear regression. This projects includes various data visualization techniques to understand the dataset in a correct manner. Also anova testing is performed. Finally the accuracy of the dataset is 88%.

THANK YOU
